

Welcome to Salvinar, Captain. You've made quite a name for yourself by successfully completing your mission on Entara. It's good to see that you've decided to participate in the great orbital ascension trials, the largest trading competition in the galaxy. Teams from every corner of the universe have gathered here, all aiming for the same goal, claiming the top position and earning the title of trading champion of the galaxy. And there is no better stage for this final act than the prosperous planet, Salvinar. The great orbital ascension trials operate in a league of their own and follow a clear set of rules. To ensure a level playing field, all prior results are set aside. Any profit earned before arriving on Salvar is considered irrelevant and your profit and loss indicator is reset to zero. This gives every team an equal opportunity to compete for the ultimate title. The objective is simple, though far from easy. You will have three trading rounds to generate more profit than any other competing team. If you reach the top of the leaderboard once round three concludes, you will be crowned trading champion of the galaxy and your legacy will echo among the stars. Trading on Salvar moves at a faster pace than you may be used to. Each trading round lasts only 48 hours. You'll need to act decisively and adapt quickly. Still, after our previous collaboration, my confidence in your abilities is at an all-time high. Let's take a look at the trading opportunities for this round. You'll have three tradable goods at your disposal. The first is hydrogel packs. These programmable bioarriers are used in Solvenar's high efficiency biotech laboratories to deliver nutrients, enzymes, and stabilizing agents to synthetic or organic tissue systems. Based on your experience with the tradable goods on Entara, I trust you'll find a way to incorporate hydrogel packs into your new Python program in a profitable manner. The second, >> it's an N64. >> Oh dear. I would have expected these interruptions to be resolved by now. Apparently, that was optimistic of me. I'll look into it after this uplink. My apologies, Captain. Let's continue. The second tradable good at your disposal is velvet fruit extract. This precision formulated extract is derived from gene optimized velvet fruit strains cultivated in Salvinar's biotech zones. It's a staple in performance optimized diets and premium spaceflight rations. Understanding its market behavior should prove useful when developing a trading strategy around it. In addition to Velvet Fruit Extract itself, you will also be able to trade velvet fruit extract vouchers. These vouchers grant the right to purchase velvet fruit extract at a later time at a predefined strike price. A total of 10 vouchers are available. Each voucher has a different strike price ranging from 4,000 to 6,500 XY. All vouchers share the same time to expiry, which is seven trading rounds. Be aware that officially we are already in trading round three. So, there are five trading rounds left until these options expire. Carefully analyzing these tradable products along with the available historical data in the data capsule would be a solid first step toward developing an initial trading strategy to translate into a Python program. The organizing committee has also announced that the Celestial Gardener Guild will make a rare appearance during this opening trading round. They are bringing a limited supply of ornamental biopods and are offering a one-time opportunity to trade with any crew that is interested. Each so-called gardener has its own reserve price. Interested trading crews may submit two bids in an attempt to strike deals with as many gardeners as possible. in pursuit of additional profit. Each gardener will accept the lowest bid that exceeds their individual reserve price. If a gardener deems your first bid too low, they will evaluate your second offer by comparing it to the global average bid submitted by other trading crews. If your second bid exceeds that average, the deal will be secured. If it falls below the average of all second bids, however, the probability of a successful trade decreases rapidly. You may wish to take into account the guild's superstition known as the power of the flowering fives. Rumor has it that their reserve prices are always set a flowering five apart. This detail may prove useful when deciding which bids to submit. The guild will remain on Salvinar for this round only. Afterward, they will depart for another planet to sell any remaining biopods. On Solvenar, these living design capsules containing engineered flora that

adapts to and enriches local environments are always met with enthusiasm. Reselling them after the guild departs should therefore not pose much of a challenge. Current market rumors suggest a value of 920 Zyrex per biopod. Any biopods you acquire will be automatically sold afterward to lock in your profits. >> Get it, Mom? It's all bits and bites. >> You can submit your bids directly through the graphical user interface, separate from your algorithmic uploads. That's a lot to take in, Captain, especially considering you've only just arrived on Solvenar. You can revisit this uplink at any time and the prosperity wiki remains available should you wish to explore these topics further at your own pace. I see you've brought your trusted onboard adviser to Salvinar as well. They may once again offer useful perspectives and inspiration as you refine your strategy. Be sure to keep a close eye on the round timer. Trading rounds on Salvinar are shorter than those on Entara, and both your algorithmic program and manual inputs must be submitted before the timer expires. That's all for now, Captain. Take a moment to let everything sink in. Not just the information, but also the fact that you are here on Salvar competing in the greatest trading challenge the galaxy has to offer. That alone is an achievement worth recognizing. I wish you the best of luck. Uplink complete. Initializing postuplink diagnostics.
